DETAILED ACTION

1. It would be of great assistance to the Office if all incoming papers pertaining to a filed application carried the following items:

1. Application number (checked for accuracy, including series code and serial no.).
2. Group art unit number (copied from most recent Office communication).
3. Filing date.
4. Name of the examiner who prepared the most recent Office action.
5. Title of invention.
6. Confirmation number (See MPEP § 503).

2. Claim 5 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 5, line 8, "the first timing signal" lack clear antecedent basis.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-5 are rejected under 35 U.S.C. 102(b) as being anticipated by Cotton et al. (5,577,075)

Cotton discloses a system for phase aligning first timing signal with the second timing signal comprising: a selection unit (75,82) coupled to a plurality of clocks (timing sources); a detection means (115,84) coupled to the selection unit for detecting a failure in the timing signal and causing the selection unit to switch

Art Unit: 2637

to another timing source (clock); a unit (95) coupled to the selection unit for comparing the phase of the first timing signal (output from 82) after switching to the phase of the second timing signal (output from 106), wherein the unit introduces gradual phase alterations to the second timing signal. The detection means comprises: an alarm activity unit coupled to the timing for detecting a failure in any one of the timing (clocks) and a control unit coupled to the alarm unit and the selection unit for determining and instructing the selection unit to switch to another timing (clock) (115,84). The system further comprises an internal timing unit (25a,GND). The unit comprises a phase detection unit coupled to the selection unit (104); a phase adjuster unit coupled to the phase detection unit (106); a low pass filter coupled to the phase detection unit (102) and an oscillator coupled to the low pass filter (100). See fig. 4 and col.9, line 40 to col.11, line 57.

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Matusevich (6,119,016) is cited to show a technique for synchronizing the timing signals.
